

CHATTANOOGA®

The Winning Combination

Independent research reveals the added value of combining Shockwave and High-Intensity Laser Therapy

IPSOS®, a global market research firm, conducted a survey with 150 physical therapists, chiropractors, and athletic trainers that uncovered how adding high-intensity laser therapy (HILT) in addition to shockwave (ESWT) impacted patient outcomes and clinic performance.

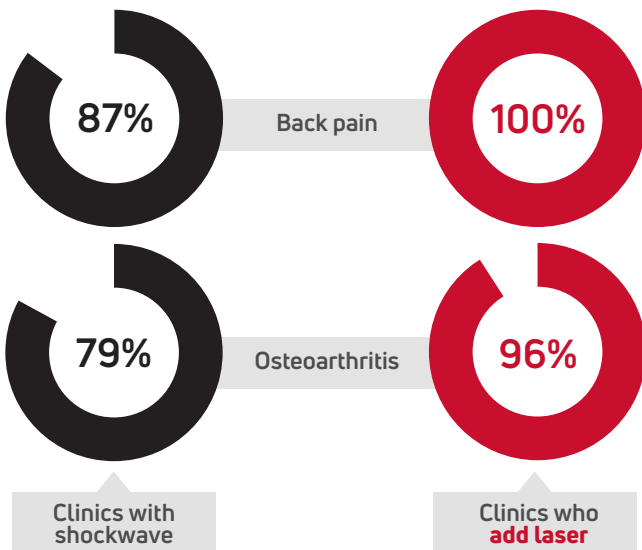

90% of clinics with both modalities report annual revenues of over \$250k

Annual revenue reported by clinic owners and operators after adding modalities to their practice.

Patient satisfaction scales with the addition of high-intensity laser therapy

Clinics that add HILT report top patient satisfaction scores, complementing the strong satisfaction of ESWT.

Percentage of clinicians reporting high satisfaction with patient outcomes.

Evidence-based care expands to more of the patients you already see

Clinics who add HILT treat more patient profiles without changing how they practice.

Patient Profile	ESWT	+HILT
Plans of care requiring 3-5 visits	●	●
Athletes requiring accelerated plans of care	●	●
Joint replacement patients with joint pain		●
Patients with thoracic pain		●
Pain intolerant patients		●
Patients who need treatment over nerve roots		●

Subset of patient profiles that can be treated with the addition of HILT.
